

REMOTE CONDENSERS

R EMOTE CONDENSERS

Desert Aire's remote condensers are designed with a commitment to excellence that will provide you with years of reliable service.

All Desert Aire equipment is consistently manufactured to high performance standards for efficient, reliable service and they are easy to install.

COILS - Round tube coils with enhanced tubing, advanced sinusoidal fin design for optimal performance. Extensive use of 5/16" and 3/8" diameter tubing keeps refrigerant charge to a minimum.

Our optional coil coating provides a uniform, flexible coating over the entire coil with negligible impact on thermal conductivity. 100% coverage is assured by the application process, even in the hard to reach center portions of the coil, without bridging between the fins. We recommend the application anytime a remote condenser is located near a salt water coast or a potential source of corrosive airborne particles.

E LEVATION CORRECTION FACTORS

Elevation above sea level has an effect on the performance of air-cooled condensers. The unit capacities shown in the Performance Table must be multiplied by the correction factors in Table 1 to correct for various elevations.

ELEVATION (FEET)	1,000	2,000	3,000	4,000	5,000	6,000	7,000
CORRECTION FACTOR	0.98	0.96	0.93	0.91	0.89	0.87	0.85

E ASY INSTALLATION

After uncrating, the condenser legs pivot from their transport to installation position and the condenser easily lifts into place with the use of eye bolts or brackets located on top of the unit. At ground level, the condenser can rest on a solid surface such as a concrete slab. On roofs, the unit should be placed on channels or an I-beam frame.

Desert Aire has a remote condenser for every application. Our complete line of direct-drive condensers complements the wide range of our dehumidification offerings.

NOTES: All data contained in this document is subject to change without notice. Please consult factory for most current data. For longer refrigerant line lengths or greater elevation difference, please consult factory.

The RCD range of condensers is sized up to 14.6 MBH/°F of heat rejection. The EC fans are controlled using PID to maintain a condenser pressure set point. Control panels are rated for 65 kA SCCR when power is supplied with class J fuses.

STANDARD FEATURES

- · Powder coated galvannealed steel cabinet
- Folding legs, for compact shipping and easy installation
- Terminal block for power connection

OPTIONAL FEATURES

- Coated coil
- · Vertical orientation with horizontal airflow
- · Non-fused or fused disconnect

Desert Aire's RC8 range of condensers is sized up to 34.8 MBH/°F of heat rejection. Swept fan blades are designed as part of the direct drive motor. The RC8 series has fully enclosed motor lead raceways to protect wiring. Control panels are rated for 10kA SCCR when power is supplied with class J fuses.

STANDARD FEATURES

- Painted G90 cabinet
- · All venturi fan panels for energy efficiency and low sound
- Door interrupt disconnect

OPTIONAL FEATURES

- E-coat on coil
- · Vertical orientation with horizontal airflow

Line sizes are based on 50ft. line set / max. 10ft. elevation difference at 35° F AT. Line connections may vary with different application ratings. Consult IO Manual.
Listed DBA values are sound ratings for the maximum number of fans in operation per RC at 3m in accordance with AHRI standard 370-2001.

L ocation of Remote Condenser System

The equipment is designed for outdoor installation and may be mounted on a roof or concrete slab. The units should be mounted level on roofs, slabs and/or structural supports that are sufficiently strong to support the total equipment operating weight. Consult a professional engineer to determine safe mounting loads.

Sufficient space for uninhibited airflow should be provided when near: overhangs; walls; pits; fences; other equipment; and building air intakes, vents or exhaust fans. Locate the remote condenser far enough away from obstructions to provide adequate clearance for ambient air inlet and discharge to prevent 1) reducing the airflow through the condenser coil; and 2) causing air recirculation which heats the air entering the coil above ambient. See Figure 3 for recommendations. Do not attach ductwork to the coil inlet or outlet. Be sure to allow ample space for maintenance work.

Locate equipment away from occupied spaces to reduce the transmission of objectionable sound and/or vibration. Use refrigerant piping flexible to prevent transmission of noise and vibration into the building. Use isolation hangers to support refrigerant lines. The unit must be secured in its final location. Holes are provided in the mounting legs for this purpose.

А

Walls or Obstructions: All sides of the unit should be a minimum of one overall unit width "W" away from any wall or barrier.

Multiple Units: For units placed side by side, the minimum distance between the units is the overall width "W" of largest unit.

Decorative Fences: Fences must have 50% free area, with 1 foot of bottom clearance, and must not extend higher than the top of the unit. Units should be a minimum of one overall width "W" away from fence.

Figure 3 - Space and Location Requirements

Units in Pits: The top of the unit must be level with, or higher than, the top of the pit. All sides of the unit should be a minimum of two overall unit widths "2W" away from any wall of the pit.

Horizontal Airflow Mount or Raised Platform Mount: The unit sides should be a minimum of one overall unit width "W" away from ground (Horizontal Airflow Mount) or wall (Raised Platform Mount). The support is provided by others and must allow airflow to access the coil.
